

Experiment 5

JUMP INSTRUCTIONS

OBJECTIVE

Learn about how to use jump instructions available on eZ8 CPU.

The following table shows jump instructions:

| Mnemonic | Operands | Instruction |
|----------|----------|---------------------------|
| JP | dst | Jump |
| JP | cc dst | Jump Conditional |
| JR | DA | Jump Relative |
| JR | cc DA | Jump Relative Conditional |

Condition Codes:

| Assembly Mnemonic | Definition | Flag Test Operation |
|-------------------|-----------------------------|--|
| F | Always False | – |
| LT | Less Than | $(S \text{ XOR } V) = 1$ |
| LE | Less Than or Equal | $(Z \text{ OR } (S \text{ XOR } V)) = 1$ |
| ULE | Unsigned Less Than or Equal | $(C \text{ OR } Z) = 1$ |
| OV | Overflow | $V = 1$ |
| MI | Minus | $S = 1$ |
| Z | Zero | $Z = 1$ |
| EQ | Equal | $Z = 1$ |
| C | Carry | $C = 1$ |
| ULT | Unsigned Less Than | $C = 1$ |
| T (or blank) | Always True | – |

Condition Codes (cont'd):

| Assembly Mnemonic | Definition | Flag Test Operation |
|-------------------|--------------------------------|--|
| GE | Greater Than or Equal | $(S \text{ XOR } V) = 0$ |
| GT | Greater Than | $(Z \text{ OR } (S \text{ XOR } V)) = 0$ |
| UGT | Unsigned Greater Than | $(C = 0 \text{ AND } Z = 0) = 1$ |
| NOV | No Overflow | $V = 0$ |
| PL | Plus | $S = 0$ |
| NZ | Non-Zero | $Z = 0$ |
| NE | Not Equal | $Z = 0$ |
| NC | No Carry | $C = 0$ |
| UGE | Unsigned Greater Than or Equal | $C = 0$ |

The following code shows briefly how to use jump instructions. Study the code and its flow chart.

```

vector reset = startup
org $1000

startup:
srp #00

part1:
ld r0, #00110101b
ld r1, #00101101b
jr part3      ; Jump to 'part3'

part2:
add r1, #100b
jr part4      ; Jump to 'part4'

part3:
ld r2, r1
xor r2, r0
jr z, part5   ; If R2 is zero, jump to 'part5'
jp 1008h      ; Jump to the instruction with PC = 1008h

part4:
inc r3
jp nz, 100dh  ; If R3 is not zero, jump to
               ; the instruction with PC = 100Dh

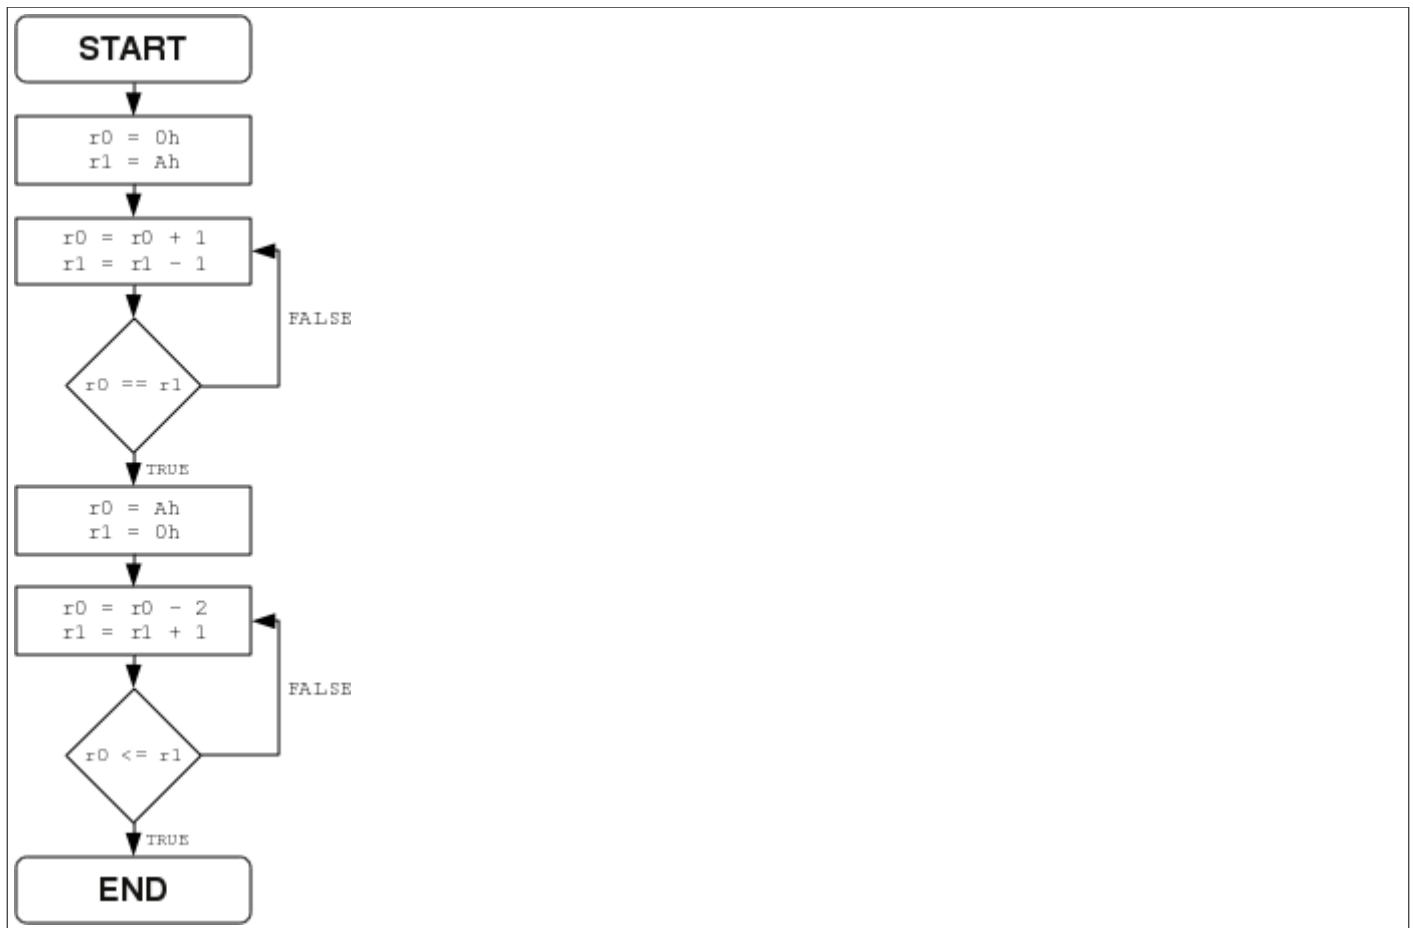

part5:
ld r0, #ffh
        
```

```

graph TD
    START([START]) --> Init["r0 = 0011 0101b  
r1 = 0010 1101b"]
    Init --> Calc["r2 = r1  
r2 = r2 XOR r0"]
    Calc --> Dec1{"r2 == 0"}
    Dec1 -- Yes --> Part5["r0 = FFh"]
    Dec1 -- No --> Add["r1 = r1 + 0100b"]
    Add --> Inc["r3 = r3 + 1"]
    Inc --> Dec2{"r3 != 0"}
    Dec2 -- Yes --> Part4["r0 = FFh"]
    Dec2 -- No --> Calc
    Part5 --> END([END])
    Part4 --> END
        
```

EXPERIMENTAL WORK

Study the following flow chart and convert it to assembly code using the methods you have learned so far.

Hint: One of the instructions from last week's arithmetical instructions table will be useful when checking values of two registers.
